

TREOSULPHAN (Group 1)

A. Evidence for carcinogenicity to humans (*sufficient*)

In one epidemiological study of 553 patients with ovarian cancer treated only with treosulphan and followed for nine years (over 1700 person-years) after treatment, 13 patients developed acute nonlymphocytic leukaemia, mostly within five years after the start of chemotherapy; the expected number of cases among the patients was less than 0.1, giving a relative risk in excess of 100. There was a significant correlation between cumulative dose of treosulphan and risk of leukaemia^{1,2}.

B. Evidence for carcinogenicity to animals

No data were available to the Working Group.

C. Other relevant data

Treosulphan is a bifunctional alkylating agent. No data were available on the genetic and related effects of this compound in humans. It induced chromosomal aberrations in plant cells³.
